Latvia – Lithuania

ICEREG

Latvian Environment, Geology and Meteorology Centre

is inviting You to take part in the Final Conference

within the project “Ice-jam flood risk management in Latvian and Lithuanian regions with respect to climate change (ICEREG)”

The aim of the ICEREG project is to improve the management of the ice-jam flood risk by developing the conceptual model of ice-jam formation and elaborating comprehensive ice flood maps for the selected pilot territories.

Ice-jam floods, being an additional source of flood risk, are a dangerous hydrological phenomenon that can cause wide inundation and make significant negative impact to the inhabitants and the economy.

During the conference we will provide information about project achievements, present the newest updates to the Flood hazard and flood risk maps and the Early warning system, as well as effective flood risk mitigation measures.
